# Geocache Icons in c:geo

c:geo uses dedicated icons for the different types of Geocaches available. The following table provides an overview of the used icons, the corresponding cache type and a basic description of the characteristic features of this cache type.

Icon	Cache Type	Basic description
	Traditional Cache	This is the oldest type of geocaches. The geocache can be found at the given coordinates.
	Multi Cache	A multi cache uses at least two locations. The geocache itself is located at the final location, but you need to visit several locations (and possibly solve questions/riddles at each stage to find out the final location).
	Earth Cache	The location of an earth cache is a location of special geological interest. The aim of these geocaches is to educate the geocachers about the geology of the earth. At the location questions need to be answered to be able to log the geocache. There is no physical geocache at the location. More information can be found at <a href="http://earthcache.org">earthcache.org</a> .
	Mystery Cache	This is the catch-all type of geocache, where the geocache is typically not located at the given coordinates but the real location has to be investigated. This can be as easy as answering some questions on the internet to obtain the coordinates or as hard as solving complicated mathematical problems.
	Wherigo Cache	Wherigo is a way to make and play GPS-enabled adventures in the real world. Using the Wherigo, the geocacher can use physical as well as virtual elements, objects or persons, to find the geocache. More information at <a href="http://wherigo.com">wherigo.com</a>
	Virtual Cache	A virtual cache location does not contain a physical geocache. At the location an assignment needs to be carried out or a question needs to be answered. If this is done correctly and the location is really visited, the geocache is found.
	Letterbox Hybrid Cache	A letterbox geocache uses clues instead of coordinates. A stamp can be found at the final location to record the visit.
	Webcam Cache	At this geocache type you need to stand in front of a public webcam and capture a picture from this cam. Afterwards the picture needs to be posted together with your log to claim the find.
	Event Cache	Sometimes geocachers organize events at a certain time and place to meet and discuss about Geocaching.
	Mega Event Cache	A Mega Event Cache is basically the same as an Event Cache, but the event is bigger. To make an event into a mega event a minimum number of 500 geocachers need to be registered.
	Giga Event Cache	A Giga Event Cache is basically the same as Mega Event Cache, but the event is even bigger. To make an event into a mega event a minimum number of 5000 geocachers need to be registered.
	CITO Event Cache	CITO Event Cache are events organized for the purpose of cleaning the environment or a similar task and (optionally) afterwards place a new geocache at the location. CITO means Cache-In-Trash-Out.
	Project APE Cache	A total of 14 Geocaches of this type were placed to support the movie "Planet of the Apes" in 2011. Each geocache represented a fictional story in which scientists revealed an Alternative Primate Evolution. Only a few geocaches exist today.
	Groundspeak Headquarter Cache	There is only one Geocache of this type in the world, located at the HQ of Groundspeak, the company behind Geocaching.com, in Seattle, WA.
	Unknown Cache Type	If this cache type is shown either c:geo could not (yet) load the cache type of this Geocache, it is a cache type not explicitly supported by c:geo (e.g. Lab Caches on geocaching.com) or it is a dedicated Unknown Type Geocache as supported on opencaching platforms.
